Florida State University, USA

Plan

- Introduction
- Evidence of the Athens OG
- Factors affecting the peaking
- Why they didn't succeed

Terminology

Peaking - obtaining the best athletic conditions at a particular moment

Two approaches to investigate the peaking

Evaluation of performance gains during the **taper**

Evaluation of performance gains during the **final stage preparation (FSP)**

Taper's background:

Taper duration – 7-30 days;
Sampling: swimmers, cyclists,
runners, weightlifters, triathletes;
Outcomes: performance
improvement of about 1-8%

Kubukeli et al., 2002; Mujika et al., 2004

FSP – general scope

FSP prior the Sydney OG – average performance improvement : US swimming team – **0.2%**;
Australia swimming team – **0.6%**

Pyne et al., 2004

Factors affecting peaking

FSP duration

Factors affecting peaking

Selection's mode

1) Tough selection

Olympic
Trials

FSP

OG

2) Liberal selection

Olympic criteria

FSP

x

a

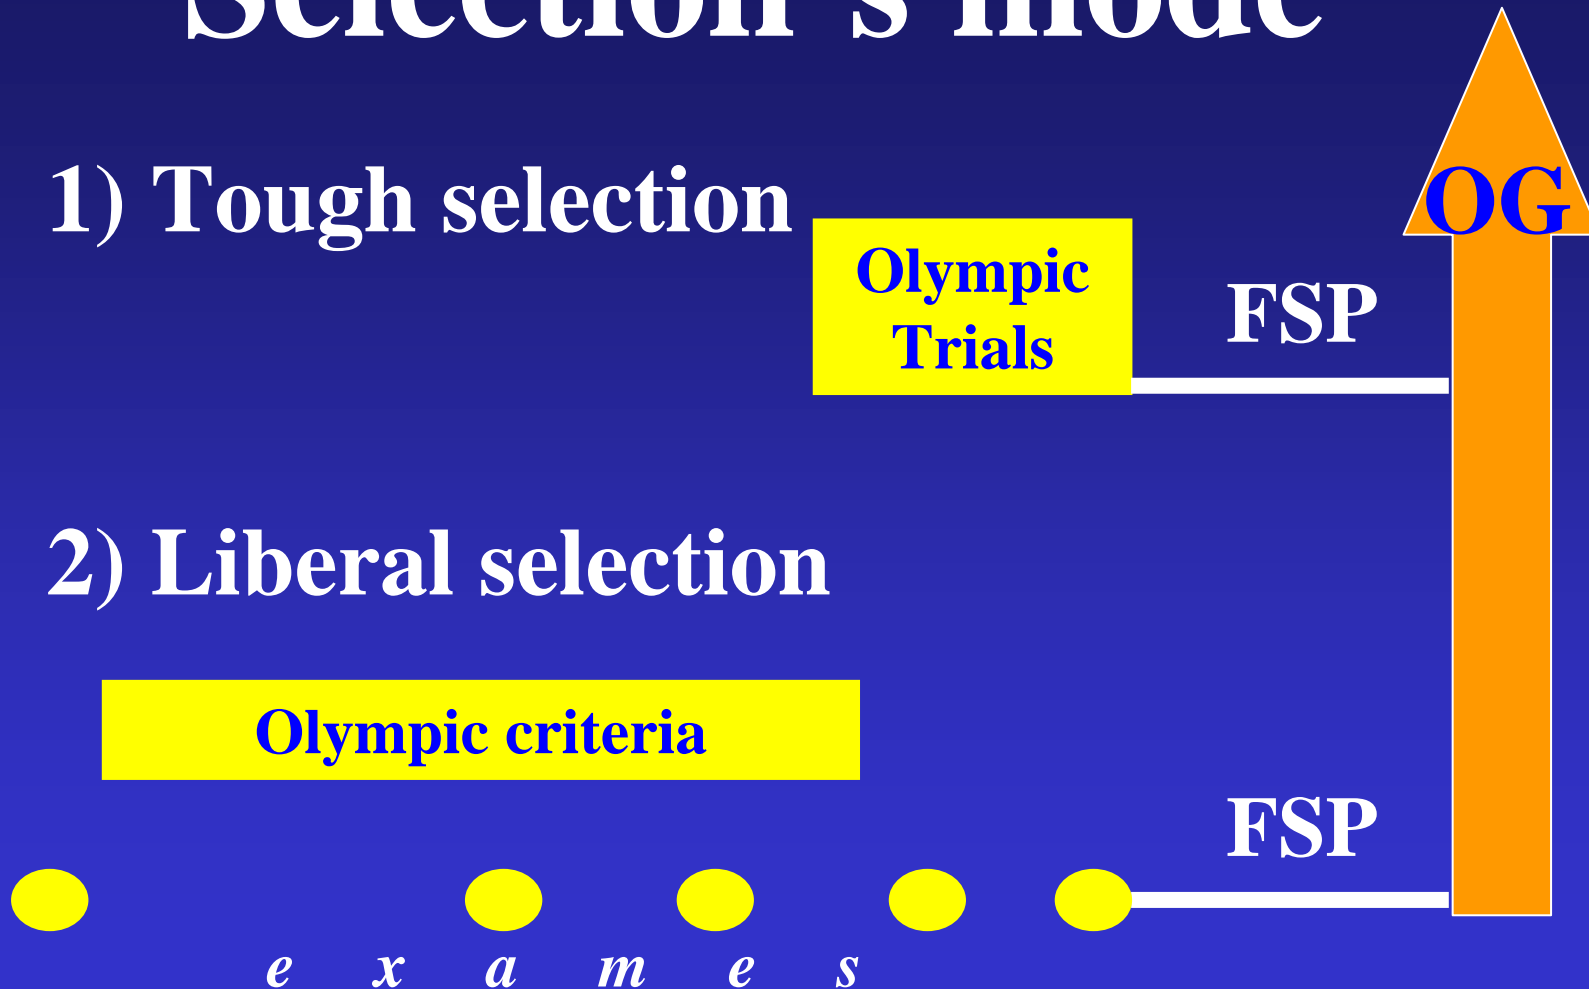

m

e

s

Factors affecting peaking

Age

Youngsters – till 20 yrs;

Middle age – 20-24 yrs;

Veterans – 25 yrs and more

Is it certain age category more favorable?

Gender

Female sex hormones can reinforce the influence of other hormones (*Viru, 1995*)

Does the athletes' gender affects the peaking?

Factors affecting peaking

Distance length

50, 100, 200, 400, 800 and 1500 m

Perhaps certain work duration is more favorable for peaking?

Swimming strokes

Is the peaking stroke dependent?

Crawl
Breaststroke
Backstroke
Butterfly
Medley

Factors affecting peaking

Personal athletic ranking

<u>Category</u>	<u>Rank</u>
Medalists	1 - 3
Finalists	4 - 8
Semi-finalists	9 - 16
Other	17 +

How the personal athletic rank affects the peaking?

Purpose:

to examine the achievement of peak-performance by world-class swimmers and
to evaluate effects of several factors determining peaking in the Athens Olympic Games.

Method

Sampling –

301 swimmers;

**424 events (212 male
and 212 female)**

Method

9 world-leading teams;
187 swimmers -
tough selection

15 National teams;
114 swimmers -
liberal selection

Method

Relative Performance Gain (*RPG%*)

$$RPG\% = \text{entry time} - \text{final time} / \text{entry time} \times 100$$

Method

Descriptive statistics

*Analysis of variance
(ANOVA)*

Linear regression

Plan

- Introduction
- Evidence of the Athens OG
- Factors affecting the peaking
- Why they didn't succeed

Swim-leading teams:

Country	Events' number
Australia	38
Canada	31
GB	31
Germany	36
Japan	30
Russia	27
USA	52
Italy	24
New Zealand	22

The FSP length

Country	FSP, days
Australia	130
Canada	33
GB	123
Germany	65
Japan	109
Russia	87-81
USA	29
Italy	151
New Zealand	131

Average improvement (%) in different teams

Results

Mean RPG%

Performance impairment

0.58%

Performance improvement

**68.2% of all Olympians
declined their performances**

RPG% by nation

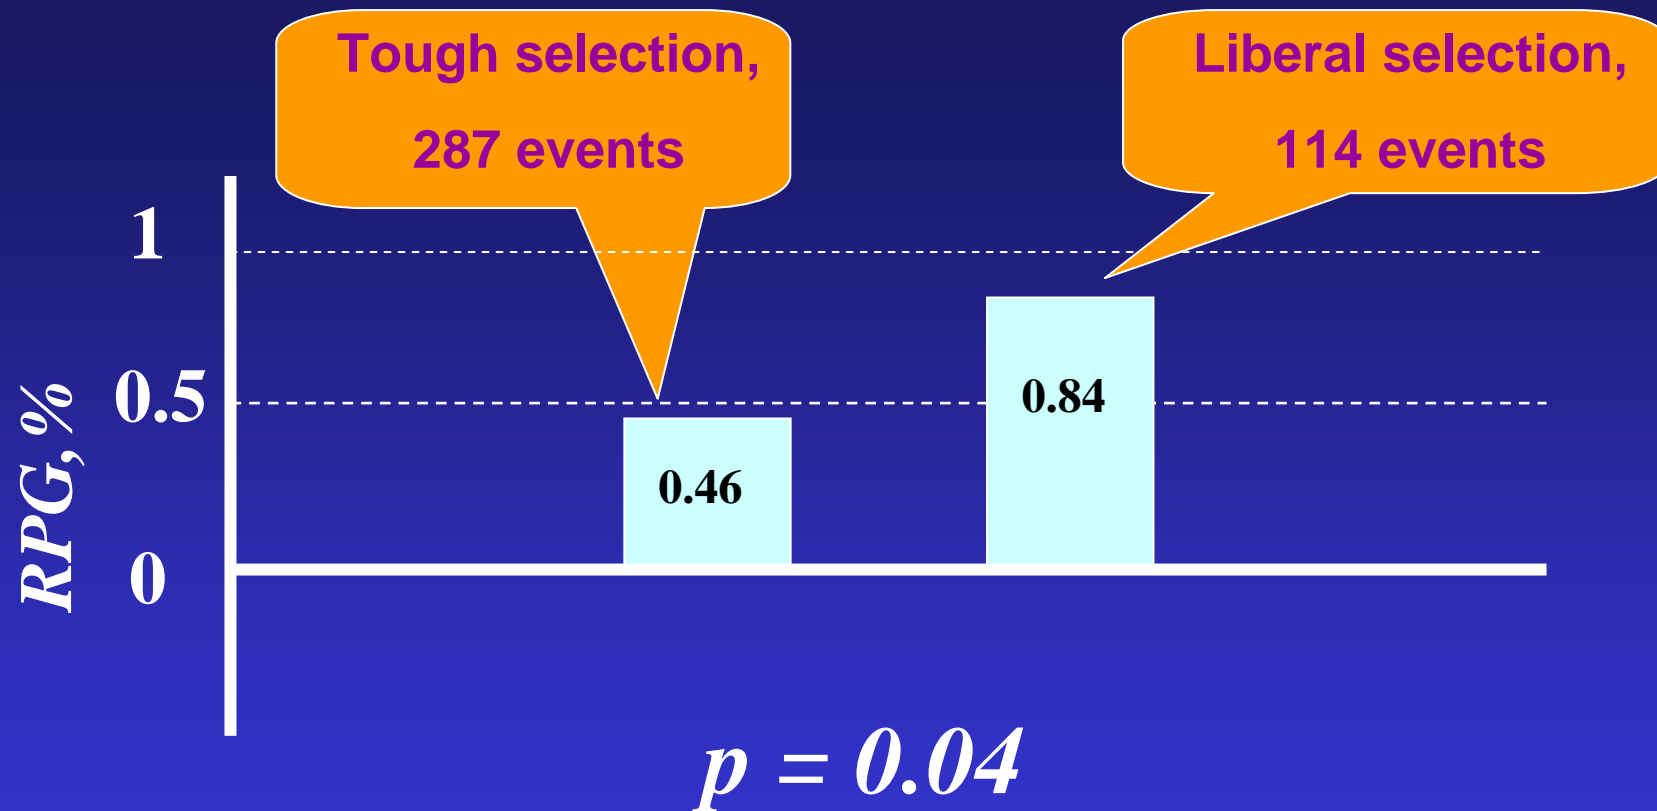

Plan

- Introduction
- Evidence of the Athens OG
- Factors affecting the peaking
- Why they didn't succeed

Results

Tough vs. liberal selection

RPG% by personal athletic rank

Impact of the FSP duration

Impact of the age

Impact of gender

No differences were found with regards to swimming strokes and distance length

Plan

- Introduction
- Evidence of the Athens OG
- Factors affecting the peaking
- Why they didn't succeed

Impact of immediate pre-Olympic preparation

Impact of immediate pre-Olympic preparation

Factors affecting performance impairment:

- (a) *emotional strain and anxiety*
- (b) *hormonal and metabolic changes induced by emotional and physical stress*
- (c) *training insufficiency during the FSP*

Facts:

Each athlete performs better when his/her level of anxiety falls within the "individual zone of optimal functioning" (Hanin,1997)

Only **30 - 45%** of competitors obtain their best results under high level of pre-competitive anxiety (Raglin & Hanin,1999)

World tendency:

**Emotional strain and anxiety
at the last Olympic events
are more pronounced than
previously**

*(Weinberg & Gould, 2003;
Blumenshtein a.o.,2004)*

Fact

The rational model of hormonal changes suggests the decline of **Testosterone** level in the mid-season with subsequent increase prior the competition, and opposite dynamics for **Cortisol** (M. & A. Viru,2000)

The increased trait anxiety suppressed excretion of **Testosterone** during post-exercise recovery (Diamard,89), similarly the **Cortisol** level is also subjected by psychological stressors (Mujika a.o.,2004)

Annual hormonal trend *by Viru, 2000*

Terminology

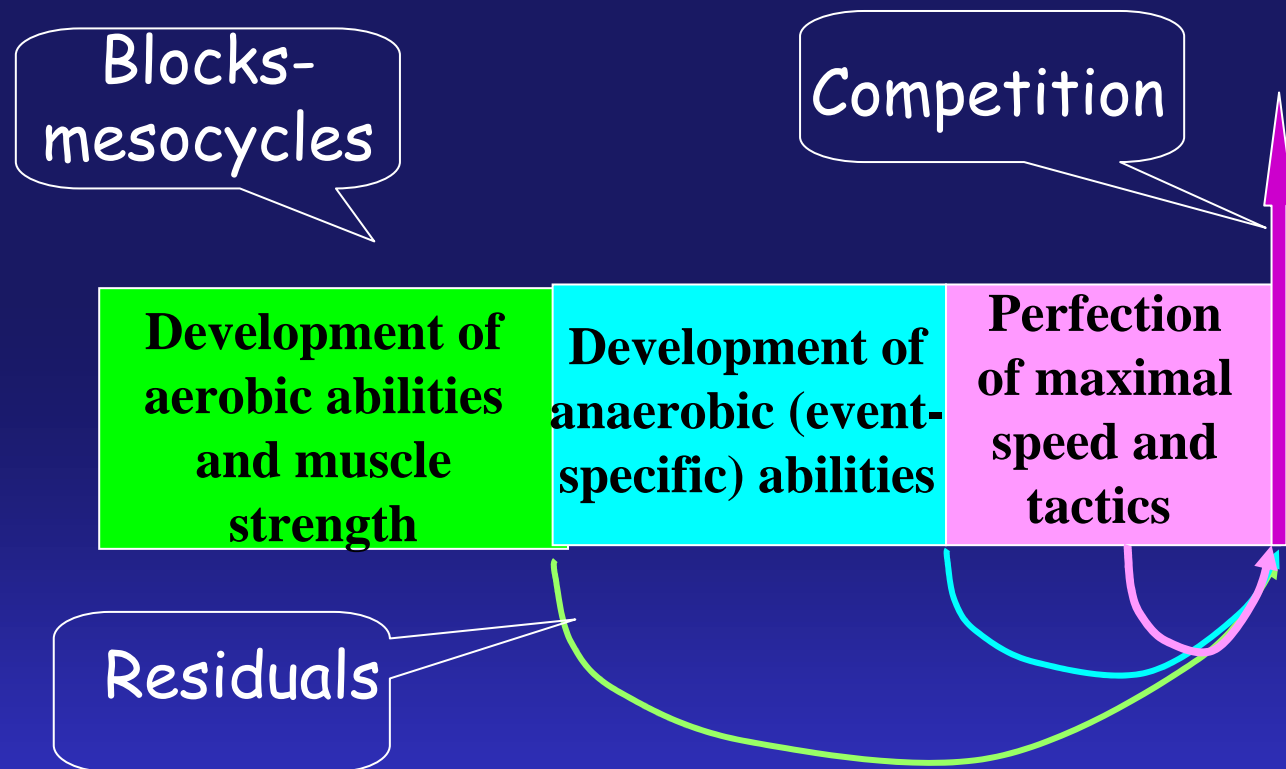

Residual training effect:

- **retention of changes in the body state and motor abilities after the cessation of training beyond certain time period**

Training insufficiency during the FSP:

- hormonal perturbations shift metabolic reactions into a direction of anaerobic prevalence and shortening of the aerobic and anabolic training residuals;
- this can follow to reduction of aerobic ability, muscle mass and power, which elicit of performance decline

Rational superposition of residual training effects

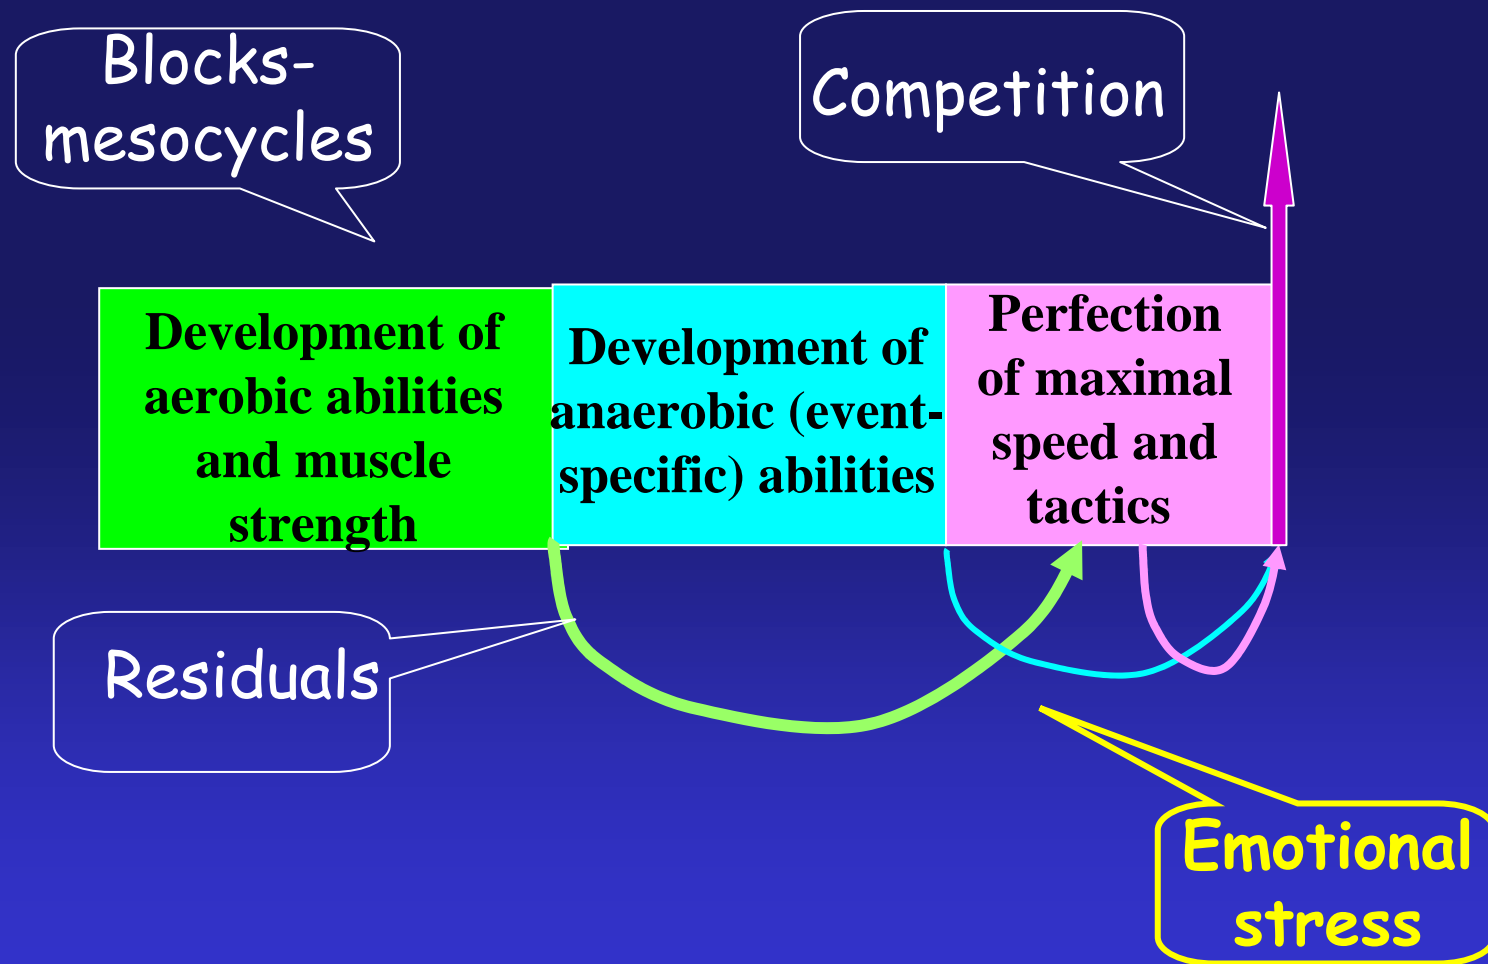

Issurin, Shkliar, 2001

Fact:

Emotional strain and
competitive activity shorten
the training residuals

(Issurin & Lustig, 2004)

Residuals' superposition transformed by emotional stress

Conclusions:

The majority of Olympians don't reach their personal best

The FSP, as a crucial stage for the peaking, should be studied, analyzed, and improved

The tough selection increases effectiveness of performances

Thank you
